To train physicians in Liquid Embolization, Guerbet installed a Tegus camera system in the Interventional Radiology Department of the Francois Mitterrand Hospital in Dijon, France.

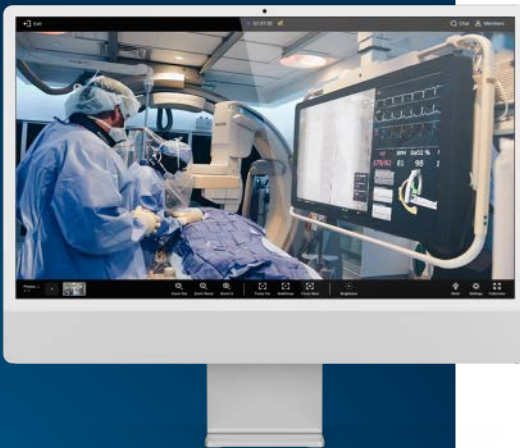

Together with Prof. Romaric Loffroy, a well-known expert in Liquid Embolization, Guerbet will offer a continues live case training program as well as online workshops on this topic in 2023.

The Tegus system allows physicians to learn in small groups by observing an expert treating a patient. Guerbet & Tegus Medical are partnering up to provide interventional radiologists with a diverse range of educational opportunities to provide them remote training.

## Why Tegus ?

Tegus Medical offers a low latency, encrypted, secure streaming platform which works in combination with a high-resolution, self-controllable camera which can provide the expert with a 360° view of the situation and the ability to focus in on screens or procedures as wished. In addition, using Bluetooth earpieces, there can be continuous conversation between the treating physician and the remote physician.

Tegus already has camera rigs installed across Europe and the Middle East and is partnering with Guerbet to install the camera system at their Centers of Excellence to complement Guerbet's training mandate for Healthcare Professionals.
